Janet Steinwedel's work with groups aims for a net increase in consciousness in the organization or community in which she is working. This is the third book in the Steinwedel Red Book Series—a series focused on the integration of Jungian psychology and executive coaching. In this book she explains her collaboration with organizations to choose a handful of leaders who will benefit from a focus on enhancing their leadership. Janet has focused on balancing the goals side of the coaching process with aspiration and inspiration in an effort to support clients on their path to individuation and wholeness. She has worked with many leaders that have been nudged out of alignment with their values and lose their passion for their work and her process is designed to bring that alignment back. In her writing she has focused on the experience of opposites including woundedness and healer, student and teacher in an effort to both deepen her personal growth and support others in their growth and development—in the movement toward wholeness. She creates safety in the group for colleagues to try new behaviors—to experiment with being in relationship. While collaboration is paramount today this relationship work is not only about the relationship with workmates, but the relationship one has with one's self. We have become a nation of strivers with a one-sided focus on greatness, she says. From one lens this is a wonderful thing, when it is out of balance it can create very dangerous leadership and consequences. The capability of observing oneself in order to be self-aware is a challenge. As soon as we try to observe our self we are no longer our self, but the self, or more correctly, the persona, we wish to be seen as. We are too often socialized to look only at our strengths and capabilities. But this is not the totality. It is not reality. It is disjointed and grandiose. And everyone suffers. Leaders who can effectively serve, guide, collaborate and be directive know their strengths and their weaknesses. They know how to build a team that supports both, providing the right balance of curiosity, experimentation and knowledge for the goals and needs of the moment. This requires, to use Jung's words, a knowledge of the times as well as a knowledge of the depths. Steinwedel sets the stage for leaders to develop by more accurately knowing their true selves through challenge to themselves and one another. They work at having empathy and compassion as well as a necessary toughness. This "emotional intelligence," popularized at the turn of the new millennium, is important to the framework of Insight Group Coaching and a natural aspect of Jungian psychology. Steinwedel presents numerous ways for leaders to develop their EQ and their engagement—an approach they can take with their own employees. In his discussions about first half of life and second half of life, Jung queries, "is there perhaps a college for forty-year olds which prepares them for their coming life and its demands as the ordinary colleges introduce our young people to the knowledge of the world?" Steinwedel believes group work can be a source for that kind of development, we invite you to read this book carefully and see if you agree.

Various combinations of commercially available technologies could greatly reduce fuel consumption in passenger cars, sport-utility vehicles, minivans, and other light-duty vehicles without compromising vehicle performance or safety. Assessment of Technologies for Improving Light Duty Vehicle Fuel Economy estimates the potential fuel savings and costs to consumers of available technology combinations for three types of engines: spark-ignition gasoline, compression-ignition diesel, and hybrid. According to its estimates, adopting the full combination of improved technologies in medium and large cars and pickup trucks with spark-ignition engines could reduce fuel consumption by 29 percent at an additional cost of \$2,200 to the consumer. Replacing spark-ignition engines with diesel engines and components would yield fuel savings of about 37 percent at an added cost of approximately \$5,900 per vehicle, and replacing spark-ignition engines with hybrid engines and components would reduce fuel consumption by 43 percent at an increase of \$6,000 per vehicle. The book focuses on fuel consumption—the amount of fuel consumed in a given driving distance—because energy savings are directly related to the amount of fuel used. In contrast, fuel economy measures how far a vehicle will travel with a gallon of fuel. Because fuel consumption data indicate money saved on fuel purchases and reductions in carbon dioxide emissions, the book finds that vehicle stickers should provide consumers with fuel consumption data in addition to fuel economy information.

Haynes manuals are written specifically for the do-it-yourselfer, yet are complete enough to be used by professional mechanics. Since 1960 Haynes has produced manuals written from hands-on experience based on a vehicle teardown with hundreds of photos and illustrations, making Haynes the world leader in automotive repair information.

From dirt bikes and jet skis to weed wackers and snowblowers, machines powered by small gas engines have become a permanent—and loud—fixture in American culture. But fifty years of high-speed fun and pristine lawns have not come without cost. In the first comprehensive history of the small-bore engine and the technology it powers, Paul R. Josephson explores the political, environmental, and public health issues surrounding one of America's most dangerous pastimes. Each chapter tells the story of an ecosystem within the United States and the devices that wreak havoc on it—personal watercraft (PWCs) on inland lakes and rivers; all-terrain vehicles (ATVs) in deserts and forests; lawn mowers and leaf blowers in suburbia. In addition to environmental impacts, Josephson discusses the development and promotion of these technologies, the legal and regulatory efforts made to improve their safety and environmental soundness, and the role of owners' clubs in encouraging responsible operation. Synthesizing information from medical journals, recent environmental research, nongovernmental organizations, and manufacturers, Josephson's compelling history leads to one irrefutable conclusion: these machines cannot be operated without loss of life and loss of habitat.
