Chemical vapor deposition is a vacuum deposition method used to produce high quality, high-performance, solid materials. The process is often used in the semiconductor industry to produce thin films. In typical CVD, the wafer is exposed to one or more volatile precursors, which react and/or decompose on the substrate surface to produce the desired deposit. Frequently, volatile by-products are also produced, which are removed by gas flow through the reaction chamber. Microfabrication processes wi

## **Thin film - Wikipedia**

Chemical Deposition is the precipitation of a metal salt dissolved in a chemical solution. The metal salt is then combined with another metal while in the solution. One common use of chemical deposition in metal finishing is in the semiconductor industry. Chemical Vapor Deposition (CVD) is one of the more common types of chemical deposition.
