Meherwan P. Boyce, in Gas Turbine Engineering Handbook (Fourth Edition), 2012. Microturbines. Microturbines are usually referred to as units of less than 350KW. These units are usually powered by either diesel fuel or natural gas. They utilize technology already developed. The microturbines can be either axial-flow or centrifugal-radial-inflow units.

The first gas turbine installed in an electric utility in the United States was applied in a combined cycle. This was a 3.5 MW gas turbine that used the energy from the exhaust gas to heat feedwater for a 35 MW conventional steam unit. The gas turbine is shown in Figure 6. A schematic showing the combined-cycle system is shown in Figure 7 ...

of today's gas turbines resemble the reaction steam turbine with the flow direction reversed. While many people today recognize the similarities between steam and gas turbine components, most do not fully appreciate the common history these two products share. His-tory tells us that the idea for the gas turbine and the steam turbine

Gas Turbine Configuration Figure 2 illustrates an MS7001FA gas turbine. It is typical of all gas turbines in commercial operation today. Gas turbines with multiple shafts, such as the heavy duty MS3002 and MS5002, and aero-derivative gas turbines, are modifications of the configurations shown in Fig. 2.
