### Ms. Doran's Biology Class - Home

Genetics is a branch of biology concerned with the study of genes, genetic variation, and heredity in organisms.. Though heredity had been observed for millennia, Gregor Mendel, a scientist and Augustinian friar working in the 19th century, was the first to study genetics scientifically. Mendel studied "trait inheritance", patterns in the way traits are handed down from parents to offspring.

### Genetics - Wikipedia

In incomplete dominance, one allele is not completely dominant. Snapdragons are a classic example of incomplete dominance. This means that the phenotype of the offspring appears to be in between the phenotype of the two parents. When a white snapdragon and a red snapdragon breed, they can have pink snapdragons.

Codominance. For some traits, two alleles can be codominant. That is to say, both are expressed in heterozygous individuals. An example of this is people who have an AB blood type for the ABO blood system. When they are tested, these individuals actually have the characteristics of both type A and type B blood.

### Mendelian & Non-Mendelian Traits in Humans: Definition ...

Mendelian traits in humans concerns how, in Mendelian inheritance, a child receiving a dominant allele from either parent will have the dominant form of the phenotypic trait or characteristic. Only those that received the recessive allele from both parents, known as zygosity, will have the recessive phenotype.Those that receive a dominant allele from one parent and a recessive allele from the ...
