Inter Process Communication is a mechanism which allows processes to communicate with each other and synchronize their actions. Whatever process is present in the system, they can communicate with each other. It is a method of cooperation. There are two types of processes -

Inter Process Communication In Operating System - Tutorialwing

Inter process communication (IPC) is a mechanism which allows processes to communicate with each other and synchronize their actions. The communication between these processes can be seen as a method of co-operation between them. Processes can communicate with each other through both: Shared Memory; Message passing

Inter-process communication - Wikipedia

Inter Process Communication (IPC) refers to a mechanism, where the operating systems allow various processes to communicate with each other. This involves synchronizing their actions and managing shared data. This tutorial covers a foundational understanding of IPC. Each of the chapters contain related topics with simple and useful examples.

Interprocess communication with C# on Linux and Windows ...

Description Understanding the concepts of processes and interprocess communications (IPC) is fundamental to developing software for Linux. This book zeroes right in on the key techniques of processes and interprocess communication - from primitive communications to the complexities of sockets.

Interprocess Communications in Linux : John Shapley Gray ...

Communication can also be multi-level such as communication between the parent, the child and the grand-child, etc. Communication is achieved by one process writing into the pipe and other reading from the pipe. To achieve the pipe system call, create two files, one to write into the file and another to read from the file.

Inter Process Communication - Pipes - Tutorialspoint

Shared memory is one of the three interprocess communication (IPC) mechanisms available under Linux and other Unix-like systems. The other two IPC mechanisms are the message queues and semaphores. In case of shared memory, a shared memory segment is created by the kernel and mapped to the data segment of the address space of a requesting process.

System V Shared Memory in Linux | SoftPrayog

In any UNIX setting, IPC (interprocess communication) support must be available for the user to pursue the materials covered in the chapters on semaphores, message queues, and shared memory. Under Solaris IPC support is enabled by default.
