Understanding Statistical Process Control: Donald J. ...

Statistical process control (SPC) is a method of quality control which employs statistical methods to monitor and control a process. This helps to ensure that the process operates efficiently, producing more specification-conforming products with less waste (rework or scrap). SPC can be applied to any process where the "conforming product" (product meeting specifications) output can be measured.

Statistical process control - Wikipedia

What is Statistical Process Control? SPC is typically defined as a method of using statistical analysis to control and measure quality, thereby improving the manufacturing process. Manufacturers collect quality real-time data in the form of process or product measurements taken from different instrumentation and machines.

Statistical process control (SPC), despite sounding esoteric, is a subject that every process owner and worker should - and can - understand, at least at a high level. Knowing whether a process is in control and stable is paramount to producing a product or service that meets customer needs. In this hour-long Minitab training course that took place in Seattle, Eduardo Santiago covers many useful topics related to SPC, including:

If the process shows control relative to the statistical limits and Run Tests for a sufficient period of time, then we can analyze process capability relative to requirements. Process capability is only meaningful when the process is stable, since we cannot predict the outcome of an unstable process.

The primary Statistical Process Control (SPC) tool for Six Sigma initiatives is the control chart — a graphical tracking of a process input or an output over time. In the control chart, these tracked measurements are visually compared to decision limits calculated from probabilities of the actual process performance.
